median
10% trimmed mean
Huber ($k = 1.345$)
Hodges–Lehmann
first-order theory (mean, median)
(d) Outliers: $(1-\varepsilon)N(0,1) + \varepsilon N(10,1)$
MSE about 0 ($n = 100$)
contamination fraction ε
(e) Tukey: $(1-\varepsilon)N(0,1) + \varepsilon N(0,3^2)$
$n \cdot$ MSE ($n = 100$)
contamination fraction ε
(f) Sensitivity curves ($n = 100$)
mean: unbounded
all others: bounded
$SC_{100}(y)$
location of the added observation y
(g) Breakdown experiment
mean
trim
HL
median, Huber
median |estimate| ($n = 101$)
fraction of observations replaced by 10^6
